

Precalculus

Introduction

Precalculus combines the trigonometric, geometric, and algebraic concepts needed to prepare students for the study of Calculus, and strengthens students' conceptual understanding of problems and mathematical reasoning in solving problems. Facility with these topics is especially important for students intending to study calculus, physics, and other sciences, and/or engineering in college. The main topics in the course are complex numbers, rational functions, trigonometric functions and their inverses, inverse functions, vectors and matrices, and parametric and polar curves. Because the standards for this course are mostly (+) standards, students selecting this Precalculus course should have met the college and career ready standards of the previous courses in the Integrated or Traditional Pathways. This course is highly suggested as preparation before taking a standard Calculus course that would lead to taking an Advanced Placement Calculus exam.

What Students Learn in Precalculus

Overview

In Precalculus, students extend their work with complex numbers begun in Mathematics III or Algebra II to see that the complex numbers can be represented in the Cartesian plane and that operations with complex numbers have a geometric interpretation. They connect their understanding of trigonometry and the geometry of the plane to express complex numbers in polar form.

Students begin working with vectors, representing them geometrically and performing operations with them. They connect the notion of vectors to the complex numbers. Students also work with matrices and their operations, experiencing for the first time an algebraic system in which multiplication is not commutative. Finally, they see the connection between matrices and transformations of the plane, namely, that a vector in the plane can be multiplied by a 2×2 matrix to produce another vector, and they work

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

31 with matrices from the point of view of transformations. They also find inverse matrices
 32 and use matrices to represent and solve linear systems.

33
 34 Students extend their work with trigonometric functions, investigating the reciprocal
 35 functions secant, cosecant, and cotangent and their graphs and properties. They find
 36 inverse trigonometric functions by appropriately restricting the domains of the standard
 37 trigonometric functions and use them to solve problems that arise in modeling contexts.

38
 39 While students have worked previously with parabolas and circles, they now work with
 40 ellipses and hyperbolas. They also work with polar coordinates and curves defined
 41 parametrically, and connect these to their other work with trigonometry and complex
 42 numbers.

43
 44 Finally, students work with more complicated rational functions, graphing them and
 45 determining zeros, y -intercepts, symmetry, asymptotes, intervals for which the function
 46 is increasing or decreasing, and maximum or minimum points.

47

48 **Connecting Standards for Mathematical Practice and Content**

49 The Standards for Mathematical Practice apply throughout each course and, together
 50 with the content standards, prescribe that students experience mathematics as a
 51 coherent, useful, and logical subject that makes use of their ability to make sense of
 52 problem situations. The Standards for Mathematical Practice (MP) represent a picture
 53 of what it looks like for students to *do mathematics in* the classroom and, to the extent
 54 possible, content instruction should include attention to appropriate practice standards.

55 The table below gives examples of how students can engage in the MP standards in
 56 Precalculus.

57

Standards for Mathematical Practice Students...	Examples of each practice in Precalculus
<i>MP1. Make sense of problems and persevere in</i>	Students expand their repertoire of expressions and functions that can used to solve problems. They grapple with understanding the connection

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

<i>solving them.</i>	between complex numbers, polar coordinates, and vectors, and reason about them.
<i>MP2. Reason abstractly and quantitatively.</i>	Students understand the connection between transformations and matrices, seeing a matrix as an algebraic representation of a transformation of the plane.
<i>MP3. Construct viable arguments and critique the reasoning of others.</i> Students build proofs by induction and proofs by contradiction. CA 3.1 (for higher mathematics only).	Students continue to reason through the solution of an equation and justify their reasoning to their peers. Students defend their choice of a function to model a real-world situation.
<i>MP4. Model with mathematics.</i>	Students apply their new mathematical understanding to real-world problems. Students also discover mathematics through experimentation and examining patterns in data from real-world contexts.
<i>MP5. Use appropriate tools strategically.</i>	Students continue to use graphing technology to deepen their understanding of the behavior of polynomial, rational, square root, and trigonometric functions.
<i>MP6. Attend to precision.</i>	Students make note of the precise definition of <i>complex number</i> , understanding that real numbers are a subset of the complex numbers. They pay attention to units in real-world problems and use unit analysis as a method for verifying their answers.
<i>MP7. Look for and make use of structure.</i>	Students understand that matrices form an algebraic system in which the order of multiplication matters, especially when solving linear systems using them. They see that complex numbers can be represented by polar coordinates, and that the structure of the plane yields a geometric interpretation of complex multiplication.
<i>MP8. Look for and make use of regularity in repeated reasoning.</i>	Students multiply several vectors by matrices and observe that some matrices give rotations or reflections. They compute with complex numbers and generalize the results to understand the geometric nature of their operations.

58
59 MP standard 4 holds a special place throughout the higher mathematics curriculum, as
60 Modeling is considered its own conceptual category. Though the Modeling category
61 has no specific standards listed within it, the idea of using mathematics to model the
62 world pervades all higher mathematics courses and should hold a high place in
63 instruction. Readers will see some standards marked with a star symbol (★) to indicate
64 that they are *modeling standards*, that is, they present an opportunity for applications to
65 real-world modeling situations more so than other standards. Note that this does not
66 preclude other standards from being taught with/through Mathematical Modeling.
67

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

68 Examples of places where specific MP standards can be implemented in the
69 Precalculus standards will be noted in parentheses, with the specific practice
70 standard(s) indicated.

71
72

73 **Precalculus Mathematics Content Standards by Conceptual Category**

74 The Precalculus course is organized by conceptual category, domains, clusters, and
75 then standards. Below, the general purpose and progression of the standards included
76 in Precalculus are described according to these conceptual categories. Note that the
77 standards are not listed in an order in which they should be taught.

78

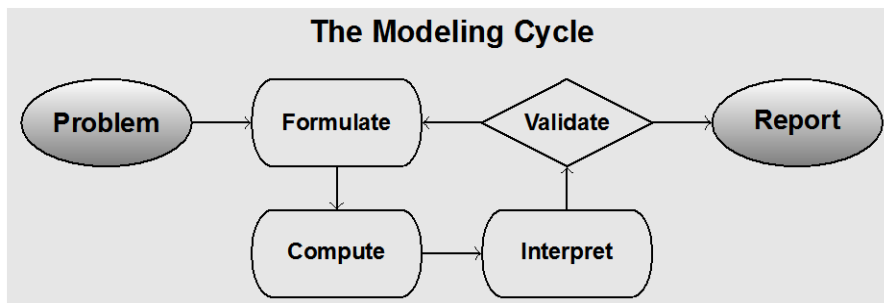

79 **Conceptual Category: Modeling**

80 Throughout the higher mathematics CA CCSSM, certain standards are marked with a
81 (*) symbol to indicate that they are considered modeling standards. Modeling at this
82 level goes beyond the simple application of previously constructed mathematics to real-
83 world problems. True modeling begins with students asking a question about the world
84 around them, and mathematics is then constructed in the process of attempting to
85 answer the question. When students are presented with a real-world situation and
86 challenged to ask a question, all sorts of new issues arise: which of the quantities
87 present in this situation are known and unknown? Students need to decide on a solution
88 path, which may need to be revised. They make use of tools such as calculators,
89 dynamic geometry software, or spreadsheets. They will try to use previously derived
90 models (e.g. linear functions) but may find that a new equation or function will apply.
91 They may see that solving an equation arises as a necessity when trying to answer their
92 question, and that oftentimes the equation arises as the specific instance of the knowing
93 the output value of a function at an unknown input value.

94

95 Modeling problems have an element of being genuine problems, in the sense that
96 students care about answering the question under consideration. In modeling,
97 mathematics is used as a tool to answer questions that students really want answered.
98 This will be a new approach for many teachers and will be challenging to implement, but
The *Mathematics Framework* was adopted by the California State Board of Education on
November 6, 2013. *The Mathematics Framework* has not been edited for publication.

99 the effort will produce students who can appreciate that mathematics is relevant to their
 100 lives. From a pedagogical perspective, modeling gives a concrete basis from which to
 101 abstract the mathematics and often serves to motivate students to become independent
 102 learners.

103
 104 Figure 1: The modeling cycle. Students examine a problem and formulate a *mathematical model* (an
 105 equation, table, graph, etc.), compute an answer or rewrite their expression to reveal new information,
 106 interpret their results, validate them, and report out.

107
 108 The reader is encouraged to consult the Appendix, “Mathematical Modeling,” for a
 109 further discussion of the modeling cycle and how it is integrated into the higher
 110 mathematics curriculum.

Conceptual Category: Functions

113 The standards of the functions conceptual category can set the stage for the learning of
 114 other standards in Precalculus. At this level, expressions are often viewed as defining
 115 outputs for functions, and algebraic manipulations are then performed meaningfully with
 116 an eye towards what can be revealed about the function.

Interpreting Functions

F-IF

Interpret functions that arise in applications in terms of the context.

- 120 4. For a function that models a relationship between two quantities, interpret key features of graphs and tables in
 121 terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. *Key*
 122 *features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative*
 123 *maximums and minimums; symmetries; end behavior; and periodicity.* ★
 124 5. Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. *For*
 125 *example, if the function h gives the number of person-hours it takes to assemble n engines in a factory, then the*
 126 *positive integers would be an appropriate domain for the function.* ★

Analyze functions using different representations.

- 127
 128
 129 7. Graph functions expressed symbolically and show key features of the graph, by hand in simple cases and using
 130 technology for more complicated cases. ★
 131 7d. (+) Graph rational functions, identifying zeros and asymptotes when suitable factorizations are available, and
 132 showing end behavior. ★

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

- 133 7e. Graph exponential and logarithmic functions, showing intercepts and end behavior, and trigonometric functions,
134 showing period, midline, and amplitude. ★
135 10. (+) Demonstrate an understanding of functions and equations defined parametrically and graph them.
136 CA★
137 11. (+) Graph polar coordinates and curves. Convert between polar and rectangular coordinate systems. CA
138

Building Functions**F-BF****Build new functions from existing functions.**

- 140
141 3. Identify the effect on the graph of replacing $f(x)$ by $f(x) + k$, $k f(x)$, $f(kx)$, and $f(x + k)$ for specific values of k (both
142 positive and negative); find the value of k given the graphs. Experiment with cases and illustrate an explanation of
143 the effects on the graph using technology. *Include recognizing even and odd functions from their graphs and*
144 *algebraic expressions for them.*
145 4. Find inverse functions.
146 b. (+) Verify by composition that one function is the inverse of another.
147 c. (+) Read values of an inverse function from a graph or a table, given that the function has an inverse.
148 d. (+) Produce an invertible function from a non-invertible function by restricting the domain.
149

150 While many of the standards in the Interpreting Functions and Building Functions
151 domains appeared in previous courses, students now apply them in the cases of
152 polynomial functions of degree greater than two, more complicated rational functions,
153 the reciprocal trigonometric functions, and inverse trigonometric functions. Students
154 examine end behavior of polynomial and rational functions and learn how to find
155 asymptotes.

156
157 Students further their understanding of inverse functions. Whereas before, students
158 only found inverse functions in simple cases (e.g. solving for x , when $f(x) = c$, finding
159 inverses of linear functions), they now explore the relationship between two functions
160 that are inverses of each other, i.e. that f and g are inverses if $(f \circ g)(x) = x$ and
161 $(g \circ f)(x) = x$, and they may begin to use inverse function notation, expressing g as
162 $g = f^{-1}$. They construct inverse functions by appropriately restricting the domain of a
163 given function and use inverses in contexts. Students in Precalculus understand how a
164 function and its domain and range are related to its inverse function. They realize that
165 finding an inverse function is more than just “switching variables” and solving an
166 equation. They can even find simpler inverses mentally, such as when they reverse the
167 “steps” for the equation $f(x) = x^3 - 1$ to realize that the inverse of f must be $f^{-1}(x) =$
168 $\sqrt[3]{x + 1}$.

169
170 Students study parametric functions in Precalculus, understanding that a curve in the
171 plane that might describe the path of a moving object can be represented with such
The *Mathematics Framework* was adopted by the California State Board of Education on
November 6, 2013. *The Mathematics Framework* has not been edited for publication.

172 functions. Students also work with polar coordinates and graph polar curves.
 173 Connections should be made between polar coordinates and the polar representation of
 174 complex numbers (N-CN.4, 5). Students also discover the important role the
 175 trigonometric functions play in working with polar coordinates. These standards are
 176 new in the typical Precalculus curriculum. Students can investigate these new concepts
 177 in modeling situations, such as by recording points on the curve a tossed ball travels
 178 along, graphing the points as vectors, and deriving equations for $x(t)$ and $y(t)$. They
 179 can also investigate the relationship between the graphs of the sine and cosine as
 180 functions of θ on the one hand and the graph of the curve defined by $x(\theta) =$
 181 $\cos \theta, y(\theta) = \sin \theta$ on the other, drawing connections between the two.

182
 183 **Trigonometric Functions** **F-TF**

184 **Expand the domain of trigonometric functions using a unit circle.**

185 4. (+) Use the unit circle to explain symmetry (odd and even) and periodicity of trigonometric functions.
 186

187 **Model periodic phenomena with trigonometric functions.**

188 6. (+) Understand that restricting a trigonometric function to a domain on which it is always increasing or always
 189 decreasing allows its inverse to be constructed.

190 7. (+) Use inverse functions to solve trigonometric equations that arise in modeling contexts; evaluate the solutions
 191 using technology, and interpret them in terms of the context. ★

192
 193 **Prove and apply trigonometric identities.**

194 9. (+) Prove the addition and subtraction formulas for sine, cosine, and tangent and use them to solve problems.

195 **10. (+) Prove the half angle and double angle identities for sine and cosine and use them to solve problems.**
 196 CA

197
 198 In this set of standards, students expand their understanding of the trigonometric
 199 functions by connecting properties of the functions to the unit circle, e.g., understanding
 200 that since that traveling 2π radians around the unit circle returns one to the same point
 201 on the circle, this must be reflected in the graphs of sine and cosine. Students extend
 202 their knowledge of finding inverses to doing so for trigonometric functions, and use them
 203 in a wide range of application problems.

204
 205 Students derive the addition and subtraction formulas for sine, cosine and tangent, as
 206 well as the half angle and double angle identities for sine and cosine, and make
 207 connections between among these. For example, students can derive from the addition
 208 formula for cosine ($\cos(x + y) = \cos x \cos y - \sin x \sin y$) the double angle formula for
 209 cosine:

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

$$\cos 2x = \cos(x + x) = \cos x \cos x - \sin x \sin x = \cos^2 x - \sin^2 x.$$

210 Another opportunity for connections arises here, as students can investigate the
211 relationship between these formulas and complex multiplication.

212

213 **Conceptual Category: Number and Quantity**

214 The Number and Quantity standards in Precalculus represent a culmination in students'
215 understanding of number systems. Students investigate the geometry of the complex
216 numbers more fully and connect it to operations with complex numbers. In addition,
217 students develop the notion of a vector and connect operations with vectors and
218 matrices to transformations of the plane.

219

220

221 **The Complex Number System**

N-CN

222 **Perform arithmetic operations with complex numbers.**

223 3. (+) Find the conjugate of a complex number; use conjugates to find moduli and quotients of
224 complex numbers.

225

226 **Represent complex numbers and their operations on the complex plane.**

227 4. (+) Represent complex numbers on the complex plane in rectangular and polar form (including real and
228 imaginary numbers), and explain why the rectangular and polar forms of a given complex number
229 represent the same number.

230 5. (+) Represent addition, subtraction, multiplication, and conjugation of complex numbers geometrically on
231 the complex plane; use properties of this representation for computation. *For example, $(-1 + \sqrt{3}i)^3 = 8$*
232 *because $(-1 + \sqrt{3}i)$ has modulus 2 and argument 120° .*

233 6. (+) Calculate the distance between numbers in the complex plane as the modulus of the difference,
234 and the midpoint of a segment as the average of the numbers at its endpoints.

235

236 As mentioned earlier, complex numbers, polar coordinates, and vectors should all be
237 taught with an emphasis on connections between them. For instance, students connect
238 the addition of complex numbers to the addition of vectors; they also investigate the
239 geometric interpretation of multiplying complex numbers and connect it to polar
240 coordinates using the polar representation.

241

242 **Vector and Matrix Quantities**

N-VM

243 **Represent and model with vector quantities.**

244 1. (+) Recognize vector quantities as having both magnitude and direction. Represent vector quantities by directed
245 line segments, and use appropriate symbols for vectors and their magnitudes (e.g., v , $|v|$, $\|v\|$, v).

246 2. (+) Find the components of a vector by subtracting the coordinates of an initial point from the coordinates of a
247 terminal point.

248 3. (+) Solve problems involving velocity and other quantities that can be represented by vectors.

249

250 **Perform operations on vectors.**

251 4. (+) Add and subtract vectors.

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

- 252 a. Add vectors end-to-end, component-wise, and by the parallelogram rule. Understand that the magnitude of a
 253 sum of two vectors is typically not the sum of the magnitudes.
 254 b. Given two vectors in magnitude and direction form, determine the magnitude and direction of their sum.
 255 c. Understand vector subtraction $v - w$ as $v + (-w)$, where $-w$ is the additive inverse of w , with the same
 256 magnitude as w and pointing in the opposite direction. Represent vector subtraction graphically by connecting
 257 the tips in the appropriate order, and perform vector subtraction component-wise.
 258 5. (+) Multiply a vector by a scalar.
 259 a. Represent scalar multiplication graphically by scaling vectors and possibly reversing their direction; perform
 260 scalar multiplication component-wise, e.g., as $c(v_x, v_y) = (cv_x, cv_y)$.
 261 b. Compute the magnitude of a scalar multiple cv using $\|cv\| = |c|v$. Compute the direction of cv knowing that
 262 when $|c|v \neq 0$, the direction of cv is either along v (for $c > 0$) or against v (for $c < 0$).
 263
 264 **Perform operations on matrices and use matrices in applications.**
 265 6. (+) Use matrices to represent and manipulate data, e.g., to represent payoffs or incidence relationships in a
 266 network.
 267 7. (+) Multiply matrices by scalars to produce new matrices, e.g., as when all of the payoffs in a game are doubled.
 268 8. (+) Add, subtract, and multiply matrices of appropriate dimensions.
 269 9. (+) Understand that, unlike multiplication of numbers, matrix multiplication for square matrices is not a commutative
 270 operation, but still satisfies the associative and distributive properties.
 271 10. (+) Understand that the zero and identity matrices play a role in matrix addition and multiplication similar to the
 272 role of 0 and 1 in the real numbers. The determinant of a square matrix is nonzero if and only if the matrix has a
 273 multiplicative inverse.
 274 11. (+) Multiply a vector (regarded as a matrix with one column) by a matrix of suitable dimensions to produce
 275 another vector. Work with matrices as transformations of vectors.
 276 12. (+) Work with 2×2 matrices as transformations of the plane, and interpret the absolute value of the determinant
 277 in terms of area.
 278

279 Students investigate vectors as geometric objects in the plane that can be represented
 280 by ordered pairs, and matrices as objects that act on vectors. Through working with
 281 vectors and matrices both geometrically and quantitatively, students discover that vector
 282 addition and subtraction behave according to certain properties, while matrices and
 283 matrix operations observe their own set of rules. Attending to structure, students
 284 discover with matrices a new set of mathematical objects and operations among them
 285 that has a multiplication that is not commutative. They find inverse matrices by hand in
 286 2×2 cases and using technology in other cases. Work with vectors and matrices here
 287 sets the stage for solving systems of equations in the Algebra conceptual category.
 288

289 **Conceptual Category: Algebra**

290 In the Algebra conceptual category, Precalculus students work with higher degree
 291 polynomials and more complicated rational functions. As always, they attend to the
 292 meaning of the expressions they work with, and the expressions they encounter often
 293 arise in the context of functions. As in all other Higher Mathematics courses, students

294 work with creating and solving equations, and do so in contexts connected to real-world
 295 situations through modeling.

296

297 **Seeing Structure in Expressions** **A-SSE**

298 **Interpret the structure of expressions.**

- 299 1. Interpret expressions that represent a quantity in terms of its context. ★
 300 a. Interpret parts of an expression, such as terms, factors, and coefficients.
 301 b. Interpret complicated expressions by viewing one or more of their parts as a single entity. *For example,*
 302 *interpret $P(1+r)^n$ as the product of P and a factor not depending on P .*
 303 2. Use the structure of an expression to identify ways to rewrite it. *For example, see $x^4 - y^4$ as $(x^2)^2 - (y^2)^2$, thus*
 304 *recognizing it as a difference of squares that can be factored as $(x^2 - y^2)(x^2 + y^2)$.*

305
 306 **Arithmetic with Polynomials and Rational Expressions** **A-APR**

307 **Rewrite rational expressions.**

- 308 6. Rewrite simple rational expressions in different forms; write $a(x)/b(x)$ in the form $q(x) + r(x)/b(x)$, where $a(x)$, $b(x)$,
 309 $q(x)$, and $r(x)$ are polynomials with the degree of $r(x)$ less than the degree of $b(x)$, using inspection, long division,
 310 or, for the more complicated examples, a computer algebra system.
 311 7. (+) Understand that rational expressions form a system analogous to the rational numbers, closed under addition,
 312 subtraction, multiplication, and division by a nonzero rational expression; add, subtract, multiply, and divide
 313 rational expressions.

314

315 By the time students are taking Precalculus, they should have a well-developed
 316 understanding the concept of a function. To make work with rational expressions more
 317 meaningful, students should be given opportunities to connect rational expressions to
 318 rational *functions*, (whose outputs are defined by the expressions). For example, a
 319 traditional exercise with rational expressions might have the following form:

$$\text{Simplify } \frac{200}{x} + \frac{100}{x-10}$$

320 with the intention that students will find a common denominator and transform the
 321 expression into $\frac{300x-2000}{x(x-10)}$. In contrast, students could view the two expressions as

322 defining the outputs of two functions f and g respectively, where $f(x) = \frac{200}{x}$ and

323 $g(x) = \frac{100}{x-10}$. In this case, f could be the function that gives the time it takes for a car to

324 travel 200 miles at an average speed of x miles per hour, while g could be the function

325 that gives the time it takes for the car to travel 100 miles at an average speed of 10 mph

326 less. Students can be asked to consider the domains of the two functions, the domain

327 on which the sum of the two functions defined by $(f + g)(x) = f(x) + g(x)$ makes

328 sense, and what the sum denotes (total time to travel the 300 miles altogether).

329 Furthermore, students can calculate tables of outputs for the two functions using a

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

330 spreadsheet, add the outputs on the spreadsheet, and then graph the resulting outputs,
 331 only to discover that the data fits the graph of the equation $y = \frac{300x-2000}{x(x-10)}$. Finally, if these
 332 expressions arise in a modeling context, students can interpret the results of studying
 333 these functions and their sum in the real-world context.

334

335 **Creating Equations** **A-CED**

336 **Create equations that describe numbers or relationships.**

- 337 1. Create equations and inequalities in one variable **including ones with absolute value** and use them to solve
 338 problems. *Include equations arising from linear and quadratic functions, and simple rational and exponential*
 339 *functions.* **CA★**
- 340 2. Create equations in two or more variables to represent relationships between quantities; graph equations on
 341 coordinate axes with labels and scales. **★**
- 342 3. Represent constraints by equations or inequalities, and by systems of equations and/or inequalities, and interpret
 343 solutions as viable or nonviable options in a modeling context. *For example, represent inequalities describing*
 344 *nutritional and cost constraints on combinations of different foods.* **★**
- 345 4. Rearrange formulas to highlight a quantity of interest, using the same reasoning as in solving equations. *For*
 346 *example, rearrange Ohm's law $V = IR$ to highlight resistance R .* **★**

347

348 **Reasoning with Equations and Inequalities** **A-REI**

349 **Solve systems of equations.**

- 350 8. (+) Represent a system of linear equations as a single matrix equation in a vector variable.
- 351 9. (+) Find the inverse of a matrix if it exists and use it to solve systems of linear equations (using technology for
 352 matrices of dimension 3×3 or greater).

353

354

355 Standards A-CED.1-4 appear in most other higher mathematics courses, as they
 356 represent common skills involved in working with equations. In Precalculus, students
 357 expand these skills into several areas: trigonometric functions, by setting up and solving
 358 equations such as $\sin 2\theta = \frac{1}{2}$; parametric functions, by making sense of the equations
 359 $x = 2t, y = 3t + 1, 0 \leq t \leq 10$; and rational expressions, by sketching a rough graph of
 360 equations such as $y = \frac{300x-2000}{x(x-10)}$.

361

362 Students connect their newfound knowledge of matrices to representing systems of
 363 linear equations by matrix multiplication. They can do this in modeling situations,
 364 involving payoffs in games, economic quantities, or geometric situations.

365

366 **Conceptual Category: Geometry**

367 The standards of the Geometry conceptual category also connect back to several other
 368 standards found in the Precalculus curriculum. For example, students work with conic

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

369 sections started, and opportunities to view conic sections as parametric functions
370 provide a rich ground for studying such functions (F-IF.10).

371
372 **Similarity, Right Triangles, and Trigonometry** **G-SRT**

373 **Apply trigonometry to general triangles.**

374 9. (+) Derive the formula $A = \frac{1}{2} ab \sin(C)$ for the area of a triangle by drawing an auxiliary line from a vertex
375 perpendicular to the opposite side.

376 10. (+) Prove the Laws of Sines and Cosines and use them to solve problems.

377 11. (+) Understand and apply the Law of Sines and the Law of Cosines to find unknown measurements in right and
378 non-right triangles (e.g., surveying problems, resultant forces).

379
380 **Expressing Geometric Properties with Equations** **G-GPE**

381 **Translate between the geometric description and the equation for a conic section.**

382 3. (+) Derive the equations of ellipses and hyperbolas given the foci, using the fact that the sum or difference of
383 distances from the foci is constant.

384 **3.1 Given a quadratic equation of the form $ax^2 + by^2 + cx + dy + e = 0$, use the method for completing the**
385 **square to put the equation in standard form; identify whether the graph of the equation is a circle,**
386 **parabola, ellipse, or hyperbola, and graph the equation. CA**

387
388 Students continue their study of trigonometric functions by discovering that they can be
389 introduced into general triangles using appropriate auxiliary lines. The relationships that
390 they give rise to then result in the Laws of Sines and Cosines in general cases.

391 Students can derive these laws and use them to solve problems, and they connect the
392 relationships they describe to the geometry of vectors.

393

394 **Precalculus Overview**

395

396 **Number and Quantity**

397 **The Complex Number System**

- 398 • Perform arithmetic operations with complex numbers.
- 399 • Represent complex numbers and their operations on the
- 400 complex plane.

401 **Vector and Matrix Quantities**

- 402 • Represent and model with vector quantities.
- 403 • Perform operations on vectors.
- 404 • Perform operations on matrices and use matrices in
- 405 applications.

406

407 **Algebra**

408 **Seeing Structure in Expressions**

- 409 • Interpret the structure of expressions.

410 **Arithmetic with Polynomials and Rational Expressions**

- 411 • Rewrite rational expressions.

412 **Creating Equations**

- 413 • Create equations that describe numbers or relationships.

414 **Reasoning with Equations and Inequalities**

- 415 • Solve systems of equations.

416

417 **Functions**

418 **Interpreting Functions**

- 419 • Interpret functions that arise in applications in terms of the context.
- 420 • Analyze functions using different representations.

421

422 **Building Functions**

- 423 • Build new functions from existing functions.

424 **Trigonometric Functions**

- 425 • Expand the domain of trigonometric functions using a unit circle.
- 426 • Model periodic phenomena with trigonometric functions.
- 427 • Prove and apply trigonometric identities.

Mathematical Practices

1. Make sense of problems and persevere in solving them.
2. Reason abstractly and quantitatively.
3. Construct viable arguments and critique the reasoning of others.
4. Model with mathematics.
5. Use appropriate tools strategically.
6. Attend to precision.
7. Look for and make use of structure.
8. Look for and express regularity in repeated reasoning.

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

428 **Geometry**429 **Similarity, Right Triangles, and Trigonometry**

- 430 • Apply trigonometry to general triangles.

431 **Expressing Geometric Properties with Equations**

- 432 • Translate between the geometric description and the equation for a conic section.

433

434

435 **Precalculus**

436

437 **Conceptual Category: Number and Quantity**

438

439 **The Complex Number System****N –CN**440 **Perform arithmetic operations with complex numbers.**

- 441 3. (+) Find the conjugate of a complex number; use conjugates to find moduli and quotients of
-
- 442 complex numbers.

443

444 **Represent complex numbers and their operations on the complex plane.**

- 445 4. (+) Represent complex numbers on the complex plane in rectangular and polar form (including real and
-
- 446 imaginary numbers), and explain why the rectangular and polar forms of a given complex number
-
- 447 represent the same number.

- 448 5. (+) Represent addition, subtraction, multiplication, and conjugation of complex numbers geometrically on
-
- 449 the complex plane; use properties of this representation for computation.
- For example, $(-1 + \sqrt{3}i)^3 = 8$*
-
- 450
- because $(-1 + \sqrt{3}i)$ has modulus 2 and argument 120° .*

- 451 6. (+) Calculate the distance between numbers in the complex plane as the modulus of the difference, and
-
- 452 the midpoint of a segment as the average of the numbers at its endpoints.

453

454 **Vector and Matrix Quantities****N –VM**455 **Represent and model with vector quantities.**

- 456 1. (+) Recognize vector quantities as having both magnitude and direction. Represent vector quantities by directed
-
- 457 line segments, and use appropriate symbols for vectors and their magnitudes (e.g.,
- v
- ,
- $|v|$
- ,
- $\|v\|$
- ,
- v
-).

- 458 2. (+) Find the components of a vector by subtracting the coordinates of an initial point from the coordinates of a
-
- 459 terminal point.

- 460 3. (+) Solve problems involving velocity and other quantities that can be represented by vectors.

461

462 **Perform operations on vectors.**

- 463 4. (+) Add and subtract vectors.

- 464 a. Add vectors end-to-end, component-wise, and by the parallelogram rule. Understand that the magnitude of a
-
- 465 sum of two vectors is typically not the sum of the magnitudes.

- 466 b. Given two vectors in magnitude and direction form, determine the magnitude and direction of their sum.

- 467 c. Understand vector subtraction
- $v - w$
- as
- $v + (-w)$
- , where
- $-w$
- is the additive inverse of
- w
- , with the same
-
- 468 magnitude as
- w
- and pointing in the opposite direction. Represent vector subtraction graphically by connecting
-
- 469 the tips in the appropriate order, and perform vector subtraction component-wise.

- 470 5. (+) Multiply a vector by a scalar.

- 471 a. Represent scalar multiplication graphically by scaling vectors and possibly reversing their direction; perform
-
- 472 scalar multiplication component-wise, e.g., as
- $c(v_x, v_y) = (cv_x, cv_y)$
- .

- 473 b. Compute the magnitude of a scalar multiple
- cv
- using
- $\|cv\| = |c|v$
- . Compute the direction of
- cv
- knowing that
-
- 474 when
- $|c|v \neq 0$
- , the direction of
- cv
- is either along
- v
- (for
- $c > 0$
-) or against
- v
- (for
- $c < 0$
-).

475

476 **Perform operations on matrices and use matrices in applications.**

- 477 6. (+) Use matrices to represent and manipulate data, e.g., to represent payoffs or incidence relationships in a
-
- 478 network.

- 479 7. (+) Multiply matrices by scalars to produce new matrices, e.g., as when all of the payoffs in a game are doubled.

- 480 8. (+) Add, subtract, and multiply matrices of appropriate dimensions.

- 481 9. (+) Understand that, unlike multiplication of numbers, matrix multiplication for square matrices is not a commutative
-
- 482 operation, but still satisfies the associative and distributive properties.

- 483 10. (+) Understand that the zero and identity matrices play a role in matrix addition and multiplication similar to the
-
- 484 role of 0 and 1 in the real numbers. The determinant of a square matrix is nonzero if and only if the matrix has a
-
- 485 multiplicative inverse.

- 486 11. (+) Multiply a vector (regarded as a matrix with one column) by a matrix of suitable dimensions to produce
-
- 487 another vector. Work with matrices as transformations of vectors.

- 488 12. (+) Work with
- 2×2
- matrices as transformations of the plane, and interpret the absolute value of the determinant
-
- 489 in terms of area.

490

491

492

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

493 **Conceptual Category: Algebra**494 **Seeing Structure in Expressions** **A-SSE**496 **Interpret the structure of expressions.**

- 497 1. Interpret expressions that represent a quantity in terms of its context. ★
- 498 a. Interpret parts of an expression, such as terms, factors, and coefficients.
- 499 b. Interpret complicated expressions by viewing one or more of their parts as a single entity. *For example,*
- 500 *interpret $P(1+r)^n$ as the product of P and a factor not depending on P .*
- 501 2. Use the structure of an expression to identify ways to rewrite it. *For example, see $x^4 - y^4$ as $(x^2)^2 - (y^2)^2$, thus*
- 502 *recognizing it as a difference of squares that can be factored as $(x^2 - y^2)(x^2 + y^2)$.*

504 **Arithmetic with Polynomials and Rational Expressions** **A-APR**505 **Rewrite rational expressions.**

- 506 6. Rewrite simple rational expressions in different forms; write $a(x)/b(x)$ in the form $q(x) + r(x)/b(x)$, where $a(x)$, $b(x)$,
- 507 $q(x)$, and $r(x)$ are polynomials with the degree of $r(x)$ less than the degree of $b(x)$, using inspection, long division,
- 508 or, for the more complicated examples, a computer algebra system.
- 509 7. (+) Understand that rational expressions form a system analogous to the rational numbers, closed under addition,
- 510 subtraction, multiplication, and division by a nonzero rational expression; add, subtract, multiply, and divide
- 511 rational expressions.

512 **Creating Equations** **A-CED**514 **Create equations that describe numbers or relationships**

- 515 1. Create equations and inequalities in one variable **including ones with absolute value** and use them to solve
- 516 problems. *Include equations arising from linear and quadratic functions, and simple rational and exponential*
- 517 *functions. CA★*
- 518 2. Create equations in two or more variables to represent relationships between quantities; graph equations on
- 519 coordinate axes with labels and scales. ★
- 520 3. Represent constraints by equations or inequalities, and by systems of equations and/or inequalities, and interpret
- 521 solutions as viable or nonviable options in a modeling context. *For example, represent inequalities describing*
- 522 *nutritional and cost constraints on combinations of different foods. ★*
- 523 4. Rearrange formulas to highlight a quantity of interest, using the same reasoning as in solving equations. *For*
- 524 *example, rearrange Ohm's law $V = IR$ to highlight resistance R . ★*

526 **Reasoning with Equations and Inequalities** **A-REI**527 **Solve systems of equations.**

- 528 8. (+) Represent a system of linear equations as a single matrix equation in a vector variable.
- 529 9. (+) Find the inverse of a matrix if it exists and use it to solve systems of linear equations (using technology for
- 530 matrices of dimension 3×3 or greater).

533 **Conceptual Category: Functions**535 **Interpreting Functions** **F-IF**536 **Interpret functions that arise in applications in terms of the context.**

- 537 4. For a function that models a relationship between two quantities, interpret key features of graphs and tables in
- 538 terms of the quantities, and sketch graphs showing key features given a verbal description of the relationship. *Key*
- 539 *features include: intercepts; intervals where the function is increasing, decreasing, positive, or negative; relative*
- 540 *maximums and minimums; symmetries; end behavior; and periodicity. ★*
- 541 5. Relate the domain of a function to its graph and, where applicable, to the quantitative relationship it describes. *For*
- 542 *example, if the function h gives the number of person-hours it takes to assemble n engines in a factory, then the*
- 543 *positive integers would be an appropriate domain for the function. ★*

545 **Analyze functions using different representations.**

- 546 7. Graph functions expressed symbolically and show key features of the graph, by hand in simple cases and using
- 547 technology for more complicated cases. ★
- 548 7d. (+) Graph rational functions, identifying zeros and asymptotes when suitable factorizations are available, and
- 549 showing end behavior. ★

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

- 550 7e. Graph exponential and logarithmic functions, showing intercepts and end behavior, and trigonometric functions,
 551 showing period, midline, and amplitude. ★
- 552 **10. (+) Demonstrate an understanding of functions and equations defined parametrically and graph them.**
 553 **CA★**
- 554 **11. (+) Graph polar coordinates and curves. Convert between polar and rectangular coordinate systems. CA**
 555
- Building Functions** **F-BF**
-
- 556 **Build new functions from existing functions.**
- 557 3. Identify the effect on the graph of replacing $f(x)$ by $f(x) + k$, $k f(x)$, $f(kx)$, and $f(x + k)$ for specific values of k (both
 558 positive and negative); find the value of k given the graphs. Experiment with cases and illustrate an explanation of
 559 the effects on the graph using technology. *Include recognizing even and odd functions from their graphs and*
 560 *algebraic expressions for them.*
- 561 4. Find inverse functions.
- 562 b. (+) Verify by composition that one function is the inverse of another.
- 563 c. (+) Read values of an inverse function from a graph or a table, given that the function has an inverse.
- 564 d. (+) Produce an invertible function from a non-invertible function by restricting the domain.
- 565
- Trigonometric Functions** **F-TF**
-
- 566 **Expand the domain of trigonometric functions using a unit circle.**
- 567 4. (+) Use the unit circle to explain symmetry (odd and even) and periodicity of trigonometric functions.
- 568
- Model periodic phenomena with trigonometric functions.**
- 569 6. (+) Understand that restricting a trigonometric function to a domain on which it is always increasing or always
 570 decreasing allows its inverse to be constructed.
- 571 7. (+) Use inverse functions to solve trigonometric equations that arise in modeling contexts; evaluate the solutions
 572 using technology, and interpret them in terms of the context. ★
- 573
- Prove and apply trigonometric identities.**
- 574 9. (+) Prove the addition and subtraction formulas for sine, cosine, and tangent and use them to solve problems.
- 575 10. (+) Prove the half angle and double angle identities for sine and cosine and use them to solve problems. **CA ★**
- 576
- Conceptual Category: Geometry**
- 577
- Similarity, Right Triangles, and Trigonometry** **G-SRT**
-
- 578 **Apply trigonometry to general triangles.**
- 579 9. (+) Derive the formula $A = 1/2 ab \sin(C)$ for the area of a triangle by drawing an auxiliary line from a vertex
 580 perpendicular to the opposite side.
- 581 10. (+) Prove the Laws of Sines and Cosines and use them to solve problems.
- 582 11. (+) Understand and apply the Law of Sines and the Law of Cosines to find unknown measurements in right and
 583 non-right triangles (e.g., surveying problems, resultant forces).
- 584
- Expressing Geometric Properties with Equations** **G-GPE**
-
- 585 **Translate between the geometric description and the equation for a conic section.**
- 586 3. (+) Derive the equations of ellipses and hyperbolas given the foci, using the fact that the sum or difference of
 587 distances from the foci is constant.
- 588 **3.1 Given a quadratic equation of the form $ax^2 + by^2 + cx + dy + e = 0$, use the method for completing the**
 589 **square to put the equation in standard form; identify whether the graph of the equation is a circle,**
