

# Technology in the Teaching of Mathematics

## The Role of Technology in Education

The field of mathematics education has changed greatly due to technology. Educational technology can facilitate simple computation and the visualization of mathematics situations and relationships, allowing students to better comprehend mathematical concepts in practice. The use of technology can be a tool for students to model mathematical relationships in real-world situations. Technology is also an integral part of the Common Core State Standards Initiative, and its effort to prepare students for college and 21<sup>st</sup> century careers.

Technology pervades our modern society. In this environment, the question is not whether educational technology will be used in the classroom, but rather how best to use it (Cheung and Slavin 2011). Current-generation students are digital natives, and the generation of teachers that will enter into the profession over the next few decades will likewise be the product of a culture where technology is a constant presence and its use in education a fundamental assumption. Training and supporting teachers in the use of technology is essential to its effective use in the classroom.

Education technology is a broad category, inclusive of both a wide range of electronic devices and the applications that deliver content and support learning. Technology is an essential tool for learning mathematics in the 21st century, but it is a tool; it cannot replace conceptual understanding, computational fluency, or problem-solving skills.

Technology tools include both content-specific technologies like computer programs. The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

26 and computational devices and content-neutral technologies like communication and  
27 collaboration tools (NCTM, Technology in Teaching and Learning Mathematics 2011).  
28 According to guidelines adopted by Massachusetts to guide the construction and  
29 evaluation of curriculum, “Technology changes the mathematics to be learned, as well  
30 as when and how it is learned... Some mathematics becomes more important because  
31 technology requires it, some becomes less important because technology replaces it,  
32 and some becomes possible because technology allows it.” (Massachusetts  
33 Department of Elementary and Secondary Education 2011)

34  
35 Research completed over the last decade has confirmed the potential benefits of  
36 education technology applied to the teaching and learning of mathematics. Education  
37 technology, when used effectively, can enhance student understanding of mathematical  
38 concepts, bolster student engagement, and strengthen problem-solving skills. Most of  
39 the recent meta-analyses of research studies in this area, however, note that these  
40 benefits are contingent upon how education technology is implemented, that it is  
41 integrated with instruction, and that teachers are trained and interested in its use  
42 (Guerrero, Walker, and Dugdale 2004; Kahveci and Imamoglu 2007; Goos and  
43 Bennison 2007; Li and Ma 2010; Cheung and Slavin 2011). This chapter will provide  
44 some suggestions and cautions on how to manage that implementation to accomplish  
45 those goals.

46

## 47 **Education Technology and the Common Core**

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

48 The use of technology is directly integrated into the California Common Core State  
49 Standards for Mathematics (CA CCSSM). The mathematics content standards  
50 encourage the use of multiple representations and modeling to help students  
51 understand the mathematical concepts behind a problem. This is an area where the use  
52 of technology can be helpful. The standards make specific reference to using  
53 technology tools in a number of cases, especially in the middle grades and high school.

54 For example, Geometry standard 7.G 2. states,

55 Draw (freehand, with ruler and protractor, and with technology) geometric  
56 shapes with given conditions. Focus on constructing triangles from three  
57 measures of angles or sides, noticing when the conditions determine a  
58 unique triangle, more than one triangle, or no triangle.

59

60 Similarly, the higher mathematics standards for algebra, functions, geometry, and  
61 statistics and probability include references to using technology to develop  
62 mathematical models, test assumptions, and conduct appropriate computations.

63

64 Technology is also an integral part of the standards for mathematical practice that are  
65 emphasized throughout the CA CCSSM, starting in kindergarten and continuing through  
66 grade twelve. It is expected that students will be able to integrate technology tools into  
67 their mathematical work. For example, the descriptive text for MP.5, “Use Appropriate  
68 Tools Strategically,” states the following:

69 Mathematically proficient students consider the available tools when  
70 solving a mathematical problem. These tools might include pencil and

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

71 paper, concrete models, a ruler, a protractor, a calculator, a spreadsheet,  
 72 a computer algebra system, a statistical package, or dynamic geometry  
 73 software. Proficient students are sufficiently familiar with tools appropriate  
 74 for their grade or course to make sound decisions about when each of  
 75 these tools might be helpful, recognizing both the insight to be gained and  
 76 their limitations. For example, mathematically proficient high school  
 77 students analyze graphs of functions and solutions generated using a  
 78 graphing calculator. They detect possible errors by strategically using  
 79 estimation and other mathematical knowledge. When making  
 80 mathematical models, they know that technology can enable them to  
 81 visualize the results of varying assumptions, explore consequences, and  
 82 compare predictions with data. Mathematically proficient students at  
 83 various grade levels are able to identify relevant external mathematical  
 84 resources, such as digital content located on a website, and use them to  
 85 pose or solve problems. They are able to use technological tools to  
 86 explore and deepen their understanding of concepts.

87 Students who gain proficiency in the CA CCSSM are expected to know not only how to  
 88 use technology tools, but also when to use them.

89

### 90 **Technology and the Common Core: Illustrative Examples**

Grade Level/ Course	Content Standards	Practice Standards	Instructional Strategy Using Technology
<b>Elementary Grades</b>			

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

K	K.CC.4.	2, 6, 7	Using a free application like “Concentration” or “Okta’s Rescue” from the National Council of Teachers of Mathematics (NCTM), students work in pairs to match number names with the corresponding numeral.
1	1.OA.6.	2, 7, 8	Using a free application like “Deep Sea Duel,” students work in pairs to find various number combinations that sum to a given number.
2	2.OA.2.	1, 6, 7	Using a free application like “Pick a Path” from the NCTM, assign a group of students to solve problems on tablet computers while others work directly with the teacher.
3	3.OA.3.	2, 3	Students record their solutions on a tablet and present to other students who in turn describe their recorded solutions on another tablet.
<b>Middle Grades</b>			
6	6.SP.3. 6.SP.4.	3, 5	Using a computer, students find a data set online and using a spreadsheet formula students calculate measures of center and variability, create a graphical representation, and write a description of the data based on the numerical and graphical evidence.
8	8.SP.1. 8.SP.2. 8.SP.3.	4, 5	<p>Students work in pairs using two graphing calculators and one ultrasonic ranging device collect data. The first student walks <i>toward</i> his/her partner who uses the ranging device partner to record the distance between them, attempting to produce a graph that is a straight line, repeating the measurements until both partners are happy with the result. The pair now reverses roles, but with the second student walking <i>away</i> from his/her recording partner. Once the data are collected the pair answer the following questions by manipulating the Time List and Distance List data stored in their two calculators:</p> <ul style="list-style-type: none"> <li>• How far away did your partner start?</li> <li>• How far away was your partner at the end of the experiment?</li> <li>• How long did the experiment last?</li> <li>• By computing <math>\frac{Dist(last) - Dist(first)}{Time(last) - Time(first)}</math> calculate your velocity and your partner’s velocity. How</li> </ul>

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

			<p>are these alike? How are these different? Explain your observations.</p> <ul style="list-style-type: none"> <li>• Compute your partner's velocity over the first half, second half, first quarter, second quarter, third quarter, and fourth quarter of the experiment to determine if your velocity was constant. How did they do?</li> <li>• Manually (or otherwise, e.g. Median-Median of Least Squares) fit a line to your partner's data and obtain an equation for the line. What are the slope and intercept of your line? How do these compare to your earlier calculations?</li> </ul>
<b>Higher Mathematics</b>			
Geometry/ Mathematics I/Mathematics II	G-CO 9. G-CO 10. G-CO 11. G-CO 12. G-CO 13.	5, 7	Using dynamic geometry software and an interactive whiteboard, students investigate and create conjectures of geometric theorems and constructions.
Mathematics I/Algebra I	S-ID.6. S-ID.7. S-ID.8. S-ID.9.	4, 5	Students use a computer to locate a bivariate data set and use statistical software to create a scatterplot and calculate the least squares regression line. Students explore the properties of this line and use it to predict and interpret relevant results.
Mathematics I/Algebra I	F-LE.3. S-ID.6.a.	2, 4, 5	As a whole class activity you need a graphing calculator, one ultrasonic ranging device, a six to nine foot wooden plank, and a large (family or industrial) sized can of a non-liquid, such as refried beans or ravioli. The plank is raised to a small incline, by propping one end on one or two textbooks. The experiment consists of collecting data on the distance between the ranging device placed at the top of the ramp and the can placed at the bottom of the ramp. The can's position on the ramp and its velocity are recorded by the ultrasonic ranging device as the can is rolled up and allowed to roll back down the ramp. Preparing for the experiment, an assistant practices rolling the can up and down. From these practice rolls, the class decides on the length of the experiment, and is asked to describe what they see. [The can's speed slows on the way up, there is an apparent pause at the

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

			<p>top, and the can speeds up as it descends the ramp.] Having decided on the length of the experiment (the number of trials) and possibly the rate of sampling, data are collected. The rolling process is repeated until a clean run is obtained. (It is not uncommon for the can to roll off the ramp.)</p> <p>The resulting graph is discussed. How close did the can get to the ranging device? The descending part of the graph corresponds to the ascent of the can. When did the can turn around? Students perform a quadratic regression and plot the resulting equation. Students compute and examine the residuals and examine them, the number negative, the number positive and the Mean Absolute Deviation to discuss the goodness of fit.</p>

91

92 Technology will also be an integrated part of the new assessment systems under  
 93 development. The multistate Smarter Balanced Assessment Consortium (Smarter  
 94 Balanced), of which California is a governing member, is developing computer-adaptive  
 95 assessments that can respond to a student's initial performance to more rapidly and  
 96 accurately identify which skills the student has mastered. These assessments will also  
 97 allow for a faster turnaround of test results, so that they can be used to inform  
 98 instruction. The Smarter Balanced test protocols will allow the use of calculators on  
 99 certain test items on the middle and high school assessments, including integrating  
 100 calculators directly into the assessment software. (For additional information, see the  
 101 "Assessment" Chapter.)

102

### 103 **Education Technology in the Classroom**

#### 104 **Handheld Devices**

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

105 For decades one of the biggest questions and largest controversies with regard to  
106 educational technology was the use of calculators in classroom instruction and  
107 assessment. Previous studies (Hembree and Dessart 1986, Loveless 2004) raised  
108 cautions about the use of calculators in the elementary grades, especially in terms of  
109 undermining students' skills at basic computation. Ellington (2003) found that  
110 calculators had the greatest benefit when used for both instruction and assessment.  
111 She noted, however, that "Students received the most benefit when calculators had a  
112 pedagogical role in the classroom and were not just available for drill and practice or  
113 checking work." Instruction needs to be structured to use technology in nonroutine ways  
114 (i.e., not in drill and computational practice), in other words where students are using it  
115 to make decisions and solve problems (Guerrero, Walker, and Dugdale 2004). More  
116 powerful graphing calculators can be used in conjunction with the technology emphasis  
117 in the CA CCSSM to allow students to actively participate in the process of developing  
118 mathematical ideas and solve problems. These devices can help students better  
119 understand spatial concepts, connect functions with graphs, and visualize written  
120 problems to develop solutions (Ellington 2003).

121  
122 The National Council of Teachers of Mathematics, in its 2011 research brief on "Using  
123 Calculators for Teaching and Learning Mathematics," stated the following conclusion  
124 after a synthesis of nearly 200 studies conducted from 1976 through 2009:

125 In general, we found that the body of research consistently shows that the  
126 use of calculators in the teaching and learning of mathematics does not  
127 contribute to any negative outcomes for skill development or procedural

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

128 proficiency, but instead enhances the understanding of mathematics

129 concepts and student orientation toward mathematics.

130 While these findings do not eliminate the need to ensure that calculators are used to

131 enhance rather than supplant students' computational and procedural skills, they do

132 provide reassurance that calculators can be integrated into instruction and assessment

133 without harming student progress toward mathematical proficiency. It is important to

134 remember that instruction and curriculum using calculators should be designed to

135 emphasize the problem-solving and conceptual skills of students.

136

137 The next generation of handheld devices with networking capabilities also offers

138 opportunities for using technology effectively in a classroom environment. Clark-Wilson

139 (2010) conducted a study of seven teachers using handheld graphing computers

140 connected via wireless network to the teacher's computer. These devices allowed

141 teachers to monitor student work and provide live feedback and enabled students to

142 lead the classroom discussion via a projector connected to the network. The

143 advantages of using these devices included promoting a "collaborative classroom"

144 where students were able to learn from each other. Clark-Wilson also noted the benefits

145 of added student engagement, a finding that was duplicated in many of the other

146 studies on the use of classroom technology.

147

148 Smart phones and tablet computers are other forms of handheld technology that are

149 becoming increasingly common in schools. Educational applications, or "apps,"

150 designed to work with these devices are proliferating. They offer the advantages of built-

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

151 in networking capability and access to the Internet, which enables immediate access to  
152 content and feedback from the teacher as noted above. Tablet computers are being  
153 used by some school districts to provide delivery of instructional materials, with  
154 advantages in terms of weight and convenience.

155

156 However, there are challenges associated with the use of handheld devices to provide  
157 instruction. Recent studies suggest that schools need to educate both students and  
158 parents about the need for policies regarding student access to and use of technology  
159 at school, but that comprehensive bans on cell phones may not be the most effective  
160 means of addressing these problems. Smart phones and tablet computers are easily  
161 lost or stolen and can be expensive to replace. Furthermore, the advantages of  
162 networked technology that is “always on” can also be disadvantages. In a 2009 national  
163 survey of middle- and high-school students, 35 percent admitted to using a cell phone to  
164 cheat, while 52 percent admitted to cheating using the Internet. The survey indicated  
165 the cultural gaps involved with new technology; for example, many of the students did  
166 not consider texting a warning about a pop quiz to fellow students, or copying text  
167 available online to turn in as their own work, to be “cheating” (Common Sense Media  
168 2009). This same survey also found that while 92 percent of parents indicated that they  
169 believed that cheating using cell phones happens at their child’s school, just 3 percent  
170 of parents said that their child had engaged in such behavior. Multiple measures of  
171 assessment with an emphasis on problem solving will provide avenues for students to  
172 demonstrate content mastery beyond rote memorization (Challenge Success 2012).

173 Computers and Software

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

174

175 Computers have become a more ubiquitous presence in schools over the last fifteen  
176 years. The number of computers has increased from approximately one computer for  
177 every eleven students in the late nineties to one computer per 5.8 students in 2010-11  
178 (CDE Educational Demographics Office 2011).

179

180 Research on the use of computer-mediated learning tools has demonstrated the  
181 potential for increased student achievement and proficiency in mathematical concepts.  
182 However, those benefits are dependent upon the teaching approaches, types of  
183 programs, and the learners themselves (Li and Ma 2010). Kahveci and Imamoglu  
184 (2007) note that mathematics instruction works best when there are high levels of  
185 interactivity between students and the content and that the most successful instructional  
186 systems are those that adapt to students, allow them to work collaboratively, and give  
187 immediate feedback. Similarly Li and Ma (2010) found that computer technology was  
188 most effective when used with constructivist teaching methods where students gain  
189 conceptual understanding through an inquiry-based, collaborative learning model.

190

191 As a more concrete example, Ruthven, Deaney, and Hennessy (2009) studied the use  
192 of graphing software in secondary schools for investigating algebraic expressions. They  
193 found that the use of the software to enable students to graph linear and quadratic  
194 equations in the classroom had positive results in terms of efficiency of instruction,  
195 student engagement, and understanding. Students could use the software to explore  
196 the topic and share their results, for example by immediately seeing the effects on a

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

197 graph of altering the coefficient in a formula-defining function. However, the authors of  
198 this study noted that despite the fact that the software had been “designed to do things  
199 easily,” the teacher’s role was still vital in structuring the activity and designing tasks  
200 that would help students master the mathematical content that was at the core of the  
201 lesson.

202

### 203 Online Learning

204 Online delivery of instruction is becoming increasingly popular. More than one million  
205 kindergarten through grade twelve students enrolled in at least one online course in  
206 2007-08 (USDE 2010). Online courses offer distinct advantages to districts in terms of  
207 cost and convenience, especially for districts where students are distributed across a  
208 wide geographic area and there might be challenges in delivering instruction in specific  
209 content areas.

210

211 While more research is being conducted on the efficacy of online instruction, preliminary  
212 findings provide reason for optimism. The United States Department of Education, in a  
213 2009/10 study of online learning, found only five studies dealing with K–12 education in  
214 its survey of research from 1996 through 2008. Of those five, only one dealt with  
215 mathematics, but in general, the study’s authors found that the outcomes for online  
216 learning were not significantly different than those from face-to-face instruction, and that  
217 programs that combined online and face-to-face learning (a “blended” or “hybrid” model)  
218 could actually produce higher outcomes in terms of student performance. The study  
219 noted that newer online applications are able to combine asynchronous tools, such as

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

220 e-mail, newsgroups, and discussion boards, with synchronous tools such as Web  
221 casting, chat, and audio/video presentations. These combinations allow students to  
222 approach the subject with more interaction between themselves and the content, their  
223 peers, and their teacher, which is more conducive to the “deep learning” that is the goal  
224 of mathematics learning. This is consistent with a sociocultural perspective on learning  
225 which states that learning takes place in social environments where social activity  
226 provides support and assistance for learning (Vygotsky, 1978, Cobb, 1994). However,  
227 the relative newness of online learning and the limited number of studies available  
228 suggest that districts should approach online instruction with caution, especially when  
229 the material is intended to replace face-to-face instruction, rather than to enhance it.

230

### 231 **Professional Development and Teacher Support**

232 The various research studies cited in this chapter share a consensus that educational  
233 technology cannot be effective at improving student outcomes without the classroom  
234 teacher playing a central role. The teacher must ensure that technological tools are  
235 used to support student understanding of mathematical concepts and practices, rather  
236 than simply entertaining students or shielding them from following mathematical  
237 practices.

238

239 Teacher attitudes toward technology can affect its implementation and effectiveness.  
240 Guerrero, Walker, and Dugdale (2004) have noted that many teachers are cautious  
241 about technology and believe that its use may potentially hinder students’  
242 understanding and learning of mathematics. Some fear, for example, that the

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

243 inappropriate use of technology may interfere with students' ability to learn number facts  
244 or basic computational skills. Others are wary of the changes to instruction that are  
245 necessary to make use of new technology in the classroom. In some cases teachers  
246 themselves are willing to use technology, but face opposition in the form of reluctant  
247 administrators or an organizational culture that is resistant to change (Goos and  
248 Bennison 2007). It is also important for administrators to ensure that teachers have the  
249 technical support necessary to keep the technology functioning and available.

250

251 Simply providing teachers with greater access to technology is not going to lead to its  
252 successful use (Goos and Bennison 2007; Walden University 2010). Using technology  
253 effectively requires changes in pedagogical approach. Utilizing the technological tools  
254 referenced in this chapter can involve changes to the working environment, to the  
255 format of lessons and activities, to the time economy of the classroom, and to the  
256 curriculum script. Therefore, any innovation in technology must be accompanied by  
257 adaptations to the teacher's craft knowledge (Ruthven, Deane, and Hennessy 2009).

258

259 A study by Walden University (2010) has examined a number of myths about the  
260 relationship between educators, technology, and 21st century skills. That study found  
261 that it is not true that newer teachers necessarily use technology more frequently. The  
262 study also suggested that teachers and administrators often have very different ideas  
263 about classroom technology, with administrators more likely to assume that technology  
264 is used and is more effective than is actually the case. Teachers surveyed indicated that  
265 they did not feel particularly well-prepared by their pre-service training programs for

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

266 implementing technology and 21st century skills. However, the study also reiterated the  
267 importance of the teacher’s role in successful implementation of classroom technology.

268

269 These findings emphasize the critical importance of training teachers in the effective  
270 use of educational technology. Specifically, mathematics teachers must be trained in  
271 using technology to enhance mathematics learning, not just how the tools work. This  
272 training should be ongoing, and not just a one-time event. Simply using technology to  
273 teach the same mathematical topics in fundamentally the same way does not take  
274 advantage of the capabilities of technology, and it may even be harmful in that it can  
275 show that technology is not worth the cost or effort of implementation (Garofalo, and  
276 others 2000).

277

### 278 **The Digital Divide and the Achievement Gap**

279 The term “digital divide” was coined in the 1990s to reference the gap in access to  
280 computers and the Internet that separated different demographic and socioeconomic  
281 groups in the United States. The concept was popularized by a series of reports  
282 conducted by the National Telecommunications and Information Administration called,  
283 “Falling through the Net” (NTIA 1995, 1998, 1999, 2000). These reports found that rural  
284 Americans, the socioeconomically disadvantaged and ethnic minorities tended to have  
285 less access to modern information and communication technology and the benefits  
286 provided by those connections.

287

288 While the gap in access has closed somewhat over the last two decades, especially  
289 with regard to access to broadband connections, it remains significant (Smith 2010). In  
290 2009, the percentage of white households that had Internet access was 79.2 percent;  
291 for African-American and Hispanic households it was 60.0 and 57.4 percent respectively  
292 (U.S. Census Bureau 2009). Furthermore, there are concerns that minorities are less  
293 likely to be involved with social media and “Web 2.0” applications that include rich  
294 content and technologies for networking and collaboration online (Payton 2003; Trotter  
295 2007). Given the overlap between the groups involved in the digital divide and the  
296 achievement gap in student performance, it is important that districts, schools, and  
297 teachers remain alert to the issue of equitable access to technology. While federal  
298 grants and other funding have helped balance the technology available to schools with  
299 disproportionate populations of students from disadvantaged groups, there may still be  
300 significant gaps in the technology that students have access to outside of their school  
301 environments. Studies have shown that gaps in access to reading material affect  
302 outcomes in reading achievement, and gaps in access to technology will have as much  
303 impact upon student success in a 21st century learning environment. Solutions to help  
304 address these gaps may include giving students access to computer resources outside  
305 of school hours, issuing technology devices to students to take home, and training  
306 teachers to be aware of these issues and providing them with strategies to address  
307 them as part of their professional development (Davis and others 2007).

308

### 309 **Accessibility**

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

310 Education technology can help ensure that all children have access to the standards-  
311 based academic curriculum. Issues of universal access are discussed in more detail in  
312 the “Universal Access” chapter of this framework, but the specific ability of technology to  
313 support students with special needs should be addressed. One of the advantages of  
314 education technology, the ability to differentiate instruction to meet varied learning  
315 needs, makes it a potentially effective tool to support the learning goals of these  
316 students.

317

318 Assistive technology can be used to help students with disabilities gain access to the  
319 core curriculum and perform functions that might otherwise be difficult or impossible.

320 This technology can be a hardware device that help a student overcome a physical  
321 disability or adaptive software that modifies content so that a student can access the  
322 curriculum. An example could be a digital talking book that reads content that a student  
323 cannot access due to a visual handicap or a learning disability that affects reading  
324 comprehension. A student with motor difficulties might use an enlarged, simplified  
325 computer keyboard, a talking computer with a joystick, head-gear, or eye selection  
326 devices. Li and Ma (2010) found that special education students were a subgroup that  
327 tended to show higher gains than other students when computer technology was used  
328 to support instruction. Software that differentiates instruction can also be used to meet  
329 the needs of students who are below grade level in mathematics. The CDE’s

330 Clearinghouse for Specialized Media and Translations

331 (<http://www.cde.ca.gov/re/pn/sm/>) produces accessible versions of textbooks,

332 workbooks assessments, and ancillary student instructional materials. Accessible

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

333 formats include braille, large print, audio, and digital files ranging from Rich Text Files  
334 (RTF), HyperText Markup Language (HTML), Digital Accessible Information System  
335 (DAISY), and Portable Document Format (PDF).

336  
337 Education technology can also be used to support English learners. Software that uses  
338 visual cues to assist in the teaching of mathematics concepts can help someone with  
339 limited-English proficiency gain understanding. A 2010 study of one district's Digital  
340 Learning Classroom project found that interactive whiteboard technology used in grades  
341 three and five increased English learners achievement and helped to close the  
342 achievement gap between English learners and students who are proficient in English  
343 (Lopez 2010).

344  
345 Finally, education technology can help to provide a challenging and interesting  
346 educational environment for advanced learners. Computer programs that include self-  
347 paced options and allow students to explore advanced concepts can keep these  
348 students engaged in the learning process. Technology that facilitates a collaborative  
349 learning environment can also help advanced students become involved in their peers'  
350 study of mathematics, a more useful outcome than simply giving these students a  
351 longer list of problems to solve or sending them off to study independently.

352 Adaptive learning software provides individualized instruction that focuses on the needs  
353 of all students and challenges them to improve mathematics achievement.

357 [CDE CalServe K-12 Service Learning Initiative Page](http://www.cde.ca.gov/ci/cr/si) ([www.cde.ca.gov/ci/cr/si](http://www.cde.ca.gov/ci/cr/si))

358 Provides information about the CalServe K-12 Service learning initiative; including the  
359 California STEM Service Learning Initiative which supports secondary school and  
360 higher education students working together to meet community needs through a STEM  
361 (Science, Technology, Engineering, and Mathematics) design process.

362

363 [California Learning Resources Network](http://www.clrn.org) (<http://www.clrn.org>)

364 Provides reviews of supplemental electronic math learning resources that include  
365 software, video, and Internet resources. CLRN also reviews online courses aligned to  
366 the Common Core State Standards.

367

368 [Math by Design](http://mathbydesign.thinkport.org/) (<http://mathbydesign.thinkport.org/>)

369 Produced as part of a national public television collaborative that was formed to create  
370 online resources focused on STEM subjects for middle school students and teachers,  
371 this free site focuses on helping middle grades students refine and build upon their  
372 knowledge of geometry and measurement through real-world simulations.

373

374 [GeoGebra](http://www.geogebra.org/cms/) (<http://www.geogebra.org/cms/>)

375 An interactive geometry, algebra, and calculus application, intended for teachers and  
376 students. Constructions can be made with points, vectors, segments, lines, polygons,  
377 conic sections, inequalities, implicit polynomials and functions. All of them can be

The *Mathematics Framework* was adopted by the California State Board of Education on November 6, 2013. *The Mathematics Framework* has not been edited for publication.

378 changed dynamically afterwards. Teachers and students can use the software to make  
379 conjectures and prove geometric theorems.
